

# Shooting Star - Grades 9-12

Students will create a drawing of a cartoon shooting star.

## WHAT YOU NEED:

Pencils

Paper

Colored pencils or crayons or pastels or markers

## TEACHER ASKS:

Students to imagine a flying star. Or play Disney's "When You Wish Upon a Star".

1. Draw three "V" shaped lines, connected end to end. These lines form the upper three points or arms of a five-pointed star.

2. Draw two more "V" shaped lines connected to the first. This fully encloses the shape of the star.

3. Draw a curved line from the uppermost point of the star. Attach it to the star's arm.

4. From the tip of that same arm, draw a long curved line. This will form the shooting star's streak or tail.

5. From the star's opposite point, draw another long curved line. Allow it to meet the previous long line at a sharp point.

6. Draw a curved line from the remaining bottom point of the star. It should meet the existing lines at a point.

7. Draw another long curved line from between the star's arms. This line should also meet the junction of the previous lines at a point.

8. Within the outline of the original star, draw another, smaller star. The lines of this star should run parallel to the lines of the original star.

9. Draw multiple small stars and circles around the shooting star.

Color your shooting star. In nature, shooting stars often appear white, yellow, or green. In popular culture, they can be any color you can imagine, so be creative!
